SALMON is an open-source software based on first-principles time-dependent density functional theory to describe optical responses and electron dynamics in matters induced by light electromagnetic fields.

INTRODUCTION

1.1 About SALMON

SALMON is an open-source computer program for ab-initio quantum-mechanical calculations of electron dynamics at the nanoscale that takes place in various situations of light-matter interactions. It is based on time-dependent density functional theory, solving time-dependent Kohn-Sham equation in real time and real space with norm-conserving pseudopotentials.

SALMON was born by unifying two scientific programs: ARTED, developed by Univ. Tsukuba group, that describes electron dynamics in crystalline solids, and GCEED, developed by Institute for Molecular Science group, that describes electron dynamics in molecules and nanostructures. It can thus describe electron dynamics in both isolated and periodic systems. It can also describe coupled dynamics of electrons and light-wave electromagnetic fields.

To run the program, SALMON requires MPI Fortran/C compiler with LAPACK libraries. SALMON has been tested and optimized to run in a number of platforms, including Linux PC Cluster with x86-64 CPU, Fujitsu FX100 supercomputer system, K-computer, and supercomputer system with Intel Xeon Phi (Knights Landing).

1.2 SALMON features

SALMON describes electron dynamics in both isolated (molecules and nanostructures) and periodic (crystalline solids) systems. SALMON first carries out ground-state calculations in the density functional theory to prepare initial configurations. SALMON then calculates electron dynamics induced by applied electric field. Employing a weak impulsive external field, SALMON can be used to calculate linear response properties such as a polarizability of molecules and a dielectric function of crystalline solids. Using pulsed electric fields, SALMON describes electron dynamics in matters induced by intense and ultrashort laser pulses.

- Ground state calculations
 - Kohn-Sham orbitals and energies
 - density of states
 - projected density of states
 - electron localization function
- Optical properties
 - Oscillator strength distribution (absorption spectrum)
 - dielectric function
- Light-induced electron dynamics
 - time evolution of Kohn-Sham orbitals

- density, current
- excitation energy
- number density of excited carriers
- Simultaneous description of electron dynamics and light pulse propagation
 - light pulse propagation as well as time evolution of Kohn-Sham orbitals
 - energy transfer from pulsed light to electrons

1.3 License

SALMON is available under Apache License version 2.0.

1.4 SALMON at Github

SALMON is developed at [GitHub.com](https://github.com)

1.5 List of developers

(Alphabetic order)

- Isabella Floss (TU Wien, Austria)
- Yuta Hirokawa (University of Tsukuba, Japan)
- Kenji Iida (Institute for Molecular Science, Japan)
- Kazuya Ishimura (Institute for Molecular Science, Japan)
- Kyung-Min Lee (Max Planck Institute for the Structure and Dynamics of Matter, Germany)
- Katsuyuki Nobusada (Institute for Molecular Science, Japan)
- Masashi Noda (University of Tsukuba, Japan)
- Tomohito Otobe (National Institutes for Quantum and Radiological Science and Technology, Japan)
- Shunsuke Sato (Max Planck Institute for the Structure and Dynamics of Matter, Germany)
- Yasushi Shinohara (University of Tokyo, Japan)
- Takashi Takeuchi (University of Tsukuba, Japan)
- Xiao-Min Tong (University of Tsukuba, Japan)

- Mitsuhiro Uemoto (University of Tsukuba, Japan)
- Kazuhiro Yabana (University of Tsukuba, Japan)
- Atsushi Yamada (University of Tsukuba, Japan)
- Shunsuke Yamada (University of Tsukuba, Japan)
- Maiku Yamaguchi (University of Tokyo, Japan)

1.6 Acknowledgements for SALMON developments

SALMON has been developed by the SALMON developers under supports by Center for Computational Sciences, University of Tsukuba, and Institute for Molecular Science. SALMON has been supported by Strategic Basic Research Programs, CREST, Japan Science and Technology Agency, under the Grand Number JPMJCR16N5, in the research area of Advanced core technology for creation and practical utilization of innovative properties and functions based upon optics and photonics. SALMON has been also supported by Ministry of Education, Culture, Sports and Technology of Japan as a social and scientific priority issue (Creation of new functional devices and high-performance materials to support next-generation industries: CDMSI) to be tackled by using post-K computer.

INSTALL AND RUN

2.1 Prerequisites

In this guide, it is assumed that readers have a basic knowledge of Unix and its command line operations. For the installation of SALMON, following packages are required.

- Fortran90/C compiler. SALMON assumes users have one of the following compilers:
 - GCC (Gnu Compiler Collection)
 - Intel Fortran/C Compiler
 - Fujitsu Compiler (at FX100 / K-Computer)
- One of the following library packages for linear algebra:
 - BLAS/LAPACK
 - Intel Math Kernel Library (MKL)
 - Fujitsu Scientific Subroutine Library 2 (SSL-II)
- Build tools:
 - CMake

If you use other compilers, you may need to change build scripts (CMake). See *Additional options in configue.py script*. If no numerical library is installed on your computer system, you may need to install BLAS/LAPACK by yourself. See *Troubleshooting of the Installation Process*.

For the installation of SALMON, we adopt the CMake tools as the first option. If there were any problems to use CMake tools in your environment, you may use the GNU make tools. See *Troubleshooting of the Installation Process*.

2.2 Download

The newest version of SALMON can be downloaded from [download page](#). To extract files from the downloaded file `salmon-<VERSION>.tar.gz`, type the following command in the command-line:

```
$ tar -zxvf ./salmon-<VERSION>.tar.gz
```

After the extraction, the following directories will be created:

SALMON	
- src	Source codes
- example	Samples

(continues on next page)

(continued from previous page)

```
| - cmakefiles CMake related files  
| - gnumakefiles GNU Makefiles for building
```

2.3 Build and Install

To compile SALMON to create executable binary files, we adopt to use CMake tools as the first option. In case you fail to build SALMON using CMake in your environment, we may use Gnu Make. See *Build using GNU Makefile*.

2.3.1 Checking CMake availability

First, examine whether CMake is usable in your environment or not. Type the following in Unix command-line:

```
$ cmake --version
```

If CMake is not installed in your system, an error message such as `cmake: command not found` will appear. If CMake is installed on your system, the version number will be shown. To build SALMON, CMake of version 3.0.2 or later is required. If you confirm that CMake of version 3.0.2 or later is installed in your system, proceed to *Build using CMake*. However, we realize that old versions of CMake are installed in many systems. If CMake is not installed or CMake of older versions is installed in your system, you need to install the new version by yourself. It is a simple procedure and explained below.

2.3.2 Installation of CMake

CMake is a cross-platform build tool. The simplest way to make CMake usable in your environment is to get the [binary distribution of CMake from the download page](#). (The file name of the binary distribution will be `cmake-<VERSION>-<PLATFORM>.tar.gz`). In standard Unix environment, a file for the platform of Linux `x86_64` will be appropriate.

To download the file, proceed as follows: We assume that you are in the directory that you extracted files from the downloaded file of SALMON, and that you will use the version 3.8.2. First get the URL of the download link from your browser, and use `wget` command in your Unix command-line:

```
$ wget https://cmake.org/files/v3.8/cmake-3.8.2-Linux-x86_64.tar.gz
```

Next, unpack the archive by:

```
$ tar -zxvf cmake-3.8.2-Linux-x86_64.tar.gz
```

and you will have the binary `make-3.8.2-Linux-x86_64/bin/cmake` in your directory.

To make the `cmake` command usable in your command-line, you need to modify the environment variable `$PATH` so that the executable of CMake are settled inside the directory specified in your `$PATH`. If you use the bash shell, you need to modify the file `~/.bashrc` that specifies the `$PATH` variable. It can be done by typing the following command in your login directory:

```
$ export PATH=<SALMON_INSTALLATION_DIRECTORY>/cmake-3.8.2-Linux-x86_64/bin:$PATH
```

and then reload the configuration by typing:

```
$ source ~/.bashrc
```

2.3.3 Build using CMake

Confirming that CMake of version 3.0.2 or later can be usable in your environment, proceed the following steps. We assume that you are in the directory SALMON.

1. Create a new temporary directory build and move to the directory:

```
$ mkdir build
$ cd build
```

2. Execute the python script “configure.py” and then make:

```
$ python ../configure.py --arch=ARCHITECTURE --prefix=...
$ make
$ make install
```

In executing the python script, you need to specify ARCHITECTURE that indicates the architecture of the CPU in your computer system such as intel-avx. The options of the ARCHITECTURE are as follows:

arch	Detail	Compiler	Numerical Library
intel-knl	Intel Knights Landing	Intel Compiler	Intel MKL
intel-knc	Intel Knights Corner	Intel Compiler	Intel MKL
intel-avx	Intel Processor (Ivy-, Sandy-Bridge)	Intel Compiler	Intel MKL
intel-avx2	Intel Processor (Haswell, Broadwell ..)	Intel Compiler	Intel MKL
intel-avx512	Intel Processor (Skylake-SP)	Intel Compiler	Intel MKL
fujitsu-fx100	FX100 Supercomputer	Fujitsu Compiler	SSL-II
fujitsu-k	Fujitsu FX100 / K-computer	Fujitsu Compiler	SSL-II

If the build is successful, you will get a file salmon.cpu at the directory salmon/bin. If you specify many-core architectures, intel-knl or intel-knc, you find a file salmon.mic or both files salmon.cpu and salmon.mic.

2.4 Files necessary to run SALMON

To run SALMON, at least two kinds of files are required for any calculations. One is an input file with the filename extension *.inp that should be read from the standard input `stdin`. This file should be prepared in the Fortran90 namelist format. Pseudopotential files of relevant elements are also required. Depending on your purpose, some other files may also be necessary. For example, coordinates of atomic positions of the target material may be either written in the input file or prepared as a separate file.

2.4.1 Pseudopotentials

SALMON utilizes norm-conserving pseudopotentials. You may find pseudopotentials of some elements in the samples prepared in `exercises-calc`. In SALMON, several formats of pseudopotentials may be usable. Pseudopotentials with an extension .fhi can be obtained from the website listed below. (This is a part of previous atomic data files for the ABINIT code.)

Pseudopotential	Website
Pseudopotentials for the ABINIT code	https://www.abinit.org/sites/default/files/PrevAtomicData/psp-links/psp-links/lda_fhi

Filenames of the pseudopotentials should be written in the input file.

2.4.2 input file

Input files are composed of several blocks of namelists:

```
&namelist1
  variable1 = int_value
  variable2 = 'char_value'
/
&namelist2
  variable1 = real8_value
  variable2 = int_value1, int_value2, int_value3
/
```

A block of namelists starts with `&namelist` line and ends with `/` line. The blocks may appear in any order.

Between two lines of `&namelist` and `/`, descriptions of variables and their values appear. Note that many variables have their default values so that it is not necessary to give values for all variables. Descriptions of the variables may appear at any position if they are between `&namelist` and `/`.

SALMON describes electron dynamics in systems with both isolated and periodic boundary conditions. The boundary condition is specified by the variable `iperiodic` in the namelist `&system`.

Calculations are usually achieved in two steps; first, the ground state calculation is carried out and then electron dynamics calculations in real time is carried out. A choice of the calculation mode is specified by the variable `calc_mode` in the namelist `&calculation`. For isolated systems, the ground state and the electron dynamics calculations should be carried out as two separate executions. First the ground state calculation is carried out specifying `calc_mode = 'GS'`. Then the real-time electron dynamics calculation is carried out specifying `calc_mode = 'RT'`. For periodic systems, two calculations should be carried out as a single execution specifying `calc_mode = 'GS_RT'`.

In `exercises-calc`, we prepare six exercises that cover typical calculations feasible by SALMON. We prepare explanations of the input files of the exercises that will help to prepare input files of your own interests.

There are more than 20 groups of namelists. A complete list of namelist variables is given in the file `SALMON/manual/input_variables.md`. Namelist variables that are used in our exercises are explained at `input-variables`.

2.5 Run SALMON

Before running SALMON, the following preparations are required as described above: The executable file of `salmon.cpu` and `salmon.mic` (if your system is the many-core machine) should be built from the source file of SALMON. An input file `inputfile.inp` and pseudopotential files should also be prepared.

The execution of the calculation can be done as follows: In single process environment, type the following command:

```
$ salmon.cpu < inputfile.inp > fileout.out
```

In multiprocess environment in which the command to execute parallel calculations using MPI is `mpiexec`, type the following command:

```
$ mpiexec -n NPROC salmon.cpu < inputfile.inp > fileout.out
```

where `NPROC` is the number of MPI processes that you will use. In many-core processor (e.g. intel-knl) environment, the execution command is:

```
$ mpiexec.hydra -n NPROC salmon.mic < inputfile.inp > fileout.out
```

The execution command and the job submission procedure depends much on local environment. We summarize general conditions to execute SALMON:

- SALMON runs in both single-process and multi-process environments using MPI.
- executable files are prepared as `/salmon/bin/salmon.cpu` and/or `/salmon/bin/salmon.mic` in the standard build procedure.
- to start calculations, `inputfile.inp` should be read through `stdin`.

2.6 Appendix

2.6.1 Additional options in `configure.py` script

Manual specifications of compiler and environment variables

In executing `configure.py`, you may manually specify compiler and environment variables instead of specifying the architecture, for example:

```
$ python ../configure.py FC=mpiifort CC=mpiicc FFLAGS="-xAVX" CFLAGS="-restrict -xAVX"
```

The major options of `configure.py` are as follows:

Commandline switch	Detail
<code>-a ARCH, --arch=ARCH</code>	Target architecture
<code>--enable-mpi, --disable-mpi</code>	enable/disable MPI parallelization
<code>--enable-scalapack, --disable-scalapack</code>	enable/disable computations with ScaLAPACK library
<code>--enable-libxc, --with-libxc</code>	see To use Libxc
<code>FC, FFLAGS</code>	User-defined Fortran Compiler, and the compiler options

To use Libxc

In SALMON, you may use [Libxc functional library](#). To use the Libxc library, some additional procedures are necessary. First you need to download the source files in your system as follows:

```
$ wget http://www.tddft.org/programs/octopus/down.php?file=libxc/4.2.1/libxc-4.2.1.  
tar.gz  
$ tar -zvxf libxc-4.2.1.tar.gz
```

Then, enter the libxc source directory and make the library as follows:

```
$ ./configure --prefix=INSTALL/PATH/OF/LIBXC  
$ make && make install
```

Finally, enter the SALMON directory and execute `configure.py` script specifying the Libxc directory:

```
$ configure.py --arch=ARCHITECTURE --prefix=PREFIX --with-libxc=INSTALL/PATH/OF/LIBXC  
$ make && make install
```

Build for single process calculations

If you use a single processor machine, specify `--disable-mpi` in executing the python script:

```
$ python ./configure.py --arch=<ARCHITECTURE> --disable-mpi
```

Build in GCC/GFortran environment

If you use GCC/GFortran compiler, specify the following flags in executing the python script:

```
$ python ./configure.py FC=gfortran CC=gcc FFLAGS=-O3 CFLAGS=-O3
```

2.6.2 Build using GNU Makefile

If CMake build fails in your environment, we recommend you to try to use Gnu Make for the build process. First, enter the directory `makefiles`:

```
$ cd SALMON/makefiles
```

In the directory, `Makefile` files are prepared for several architectures:

- fujitsu
- gnu
- gnu-without-mpi
- intel
- intel-avx
- intel-avx2
- intel-knc
- intel-knl
- intel-without-mpi

`Makefile` files with `*-without-mpi` indicate that they are for single processor environment. Choose `Makefile` appropriate for your environment, and execute the make command:

```
$ make -f Makefile.PLATFORM
```

If the make proceeds successful, a binary file is created in the directory `SALMON/bin/.`

2.7 Troubleshooting of the Installation Process

2.7.1 Installation of CMake

The `CMake` is a cross-platform build tool. In order to build the SALMON from the source code, the `CMake` of version 3.0.2 or later is required. You may install it following one of the three instructions below.

Installation of pre-compiled binary

You can get the binary distribution from the [download page](#). First, move to the directory that you installed SALMON,

```
cd <SALMON_INSTALLATION_DIRECTORY>
```

and download the binary distribution (`cmake-<VERSION>-<PLATFORM>.tar.gz`) appropriate for your platform. You can do it by copy the URL of download link from the browser, and use `wget` command:

```
wget https://cmake.org/files/v3.8/cmake-3.8.2-Linux-x86_64.tar.gz
```

In this document, we will use version 3.8.2 as an example. You can unpack the downloaded archive

```
tar -zxvf cmake-3.8.2-Linux-x86_64.tar.gz
```

and you will have the binary `make-3.8.2-Linux-x86_64/bin/cmake`.

Next, to utilize the `cmake` command, it is required that the executable are settled inside the directory specified in your `$PATH`. If you use the bash shell, edit `~/.bashrc` and append the line:

```
export PATH=<SALMON_INSTALLATION_DIRECTORY>/cmake-3.8.2-Linux-x86_64/bin:$PATH
```

and reload the configuration:

```
source ~/.bashrc
```

Installation by package manager

If your system has a built-in package manager, you may conveniently install the CMake tools as below:

Debian/Ubuntu Linux

```
sudo apt-get install cmake
```

Fedor a Linux/CentOS

```
sudo yum install cmake
```

openSUSE Linux

```
sudo zypper install cmake
```

Installation from source code

You can get the source code distribution from the [download page](#). In this time, we will use the `cmake` version 3.8.2 as an example. Download the archive by `wget` comamnd and unpack it as below:

```
wget https://cmake.org/files/v3.8/cmake-3.8.2.tar.gz
tar -zxvf cmake-3.8.2.tar.gz
```

And, move to the unpacked directory and build.

```
cd cmake-3.8.2
./configure --prefix=INSTALLATION_DIRECTORY
make
make install
```

(replace `INSTALLATION_DIRECTORY` to your installation directory.)

Next, to utilize the `cmake` command, it is required that the executable are settled inside the directory specified in your `$PATH`. If you use the bash shell, edit `~/.bashrc` and append the line:

```
export PATH=INSTALLATION_DIRECTORY/bin:$PATH
```

and reload the configuration:

```
source ~/.bashrc
```

2.7.2 Installation of BLAS/LAPACK

INPUTS

We here summarize namelists that appear in this Tutorial. A thorough list of the namelist variables may be found in the downloaded file in ‘SALMON/manual/input_variables.md’.

3.1 &units

Mandatory: none

```
&units
    unit_system='A_eV_fs'
/
```

This namelist specifies the unit system to be used in the input file. Options are ‘A_eV_fs’ for Angstrom, eV, and fs, and ‘a.u.’ or ‘au’ for atomic units. If you do not specify it, atomic unit will be used as default.

For isolated systems (specified by `iperiodic = 0` in `&system`), the unit of 1/eV is used for the output files of DOS and PDOS if `unit_system = 'A_eV_fs'` is specified, while atomic unit is used if not. For other output files, the Angstrom/eV/fs units are used irrespective of the namelist value.

For periodic systems (specified by `iperiodic = 3` in `&system`), the unit system specified by this namelist variable is used for most output files. See the first few lines of output files to confirm the unit system adopted in the file.

3.2 &calculation

Mandatory: calc_mode

```
&calculation
    calc_mode = 'GS'
/
```

The value of the `calc_mode` should be one of ‘GS’, ‘RT’, and ‘GS-RT’. For isolated systems (specified by `iperiodic = 3` in `&system`), the ground state (‘GS’) and the real time (‘RT’) calculations should be done separately and sequentially. For periodic systems (specified by `iperiodic = 3` in `&system`), both ground state and real time calculations should be carried out as a single task (`calc_mode = 'GS_RT'`).

For Maxwell + TDDFT multi-scale calculation, add the following namelist, `use_ms_maxwell = 'y'`.

3.3 &control

Mandatory: none

```
&control
  sysname = 'C2H2'
/
```

'C2H2' defined by `sysname = 'C2H2'` will be used in the filenames of output files. If you do not specify it, the file name will start with 'default'.

3.4 &functional

```
&functional
  xc = 'PZ'
/
```

`xc = 'PZ'` indicates that (adiabatic) local density approximation is adopted (Perdew-Zunger: Phys. Rev. B23, 5048 (1981)). This is the default choice.

For isolated systems (specified by `iperiodic = 0` in `&system`), only the default choice of 'PZ' is available at present.

For periodic systems (specified by `iperiodic = 3` in `&system`), the following functionals may be available in addition to 'PZ', `xc = 'PZM'`

Perdew-Zunger LDA with modification to improve smooth connection between high density form and low density one, `xc = 'TBmBJ'` `cval = 1.0`:J. P. Perdew and Alex Zunger, Phys. Rev. B 23, 5048 (1981).

Tran-Blaha meta-GGA exchange with Perdew-Wang correlation. :Fabien Tran and Peter Blaha, Phys. Rev. Lett. 102, 226401 (2009). John P. Perdew and Yue Wang, Phys. Rev. B 45, 13244 (1992). This potential is known to provide a reasonable description for the bandage of various insulators. For this choice, the additional mixing parameter 'cval' may be specified. If `cval` is set to a minus value, the mixing-parameter will be computed following the formula in the original paper [Phys. Rev. Lett. 102, 226401 (2009)]. The default value for this parameter is 1.0.

Since version 1.1.0, exchange-correlation functionals in Libxc library (<http://www.tddft.org/programs/libxc/>) have been usable in SALMON. At present, usable functionals are limited to LDA and GGA. For periodic systems, meta-GGA functionals are usable as well. To specify the exchange-correlation potentials of Libxc library, there are two ways. If the exchange and correlation potentials are given separately, you need to specify both `alibx` and `alibc` separately. If the exchange and correlation potentials are given as a combined set, you need to specify `alibxc`. We show below an example:

```
&functional
alibx = 'LDA_X'
alibc = 'LDA_C_PZ'
/
```

Available sets of the functionals are listed at the website <http://www.tddft.org/programs/libxc/functional/>.

Note that, the hybrid functionals (hybrid gga/mgga) are not supported in the current (version 1.1.0) of SALMON.

3.5 &system

Mandatory: `iperiodic`, `al`, `nstate`, `nelem`, `natom`

For an isolated molecule (Tutorial-1, 2, 3):

```
&system
  iperiodic = 0
  al = 16d0, 16d0, 16d0
  nstate = 5
  nelem = 2
  natom = 4
  nelec = 10
/
```

`iperiodic = 0` indicates that the isolated boundary condition will be used in the calculation. `al = 16d0, 16d0, 16d0` specifies the lengths of three sides of the rectangular parallelepiped where the grid points are prepared. `nstate = 5` indicates the number of Kohn-Sham orbitals to be solved. `nelec = 10` indicate the number of valence electrons in the system. Since the present code assumes that the system is spin saturated, `nstate` should be equal to or larger than `nelec/2`. `nelem = 2` and `natom = 4` indicate the number of elements and the number of atoms in the system, respectively.

For a periodic system (Tutorial-4, 5):

```
&system
  iperiodic = 3
  al = 10.26d0,10.26d0,10.26d0
  nstate = 32
  nelec = 32
  nelem = 1
  natom = 8
/
```

`iperiodic = 3` indicates that three dimensional periodic boundary condition (bulk crystal) is assumed. `al = 10.26d0, 10.26d0, 10.26d0` specifies the lattice constants of the unit cell. `nstate = 32` indicates the number of Kohn-Sham orbitals to be solved. `nelec = 32` indicate the number of valence electrons in the system. `nelem = 1` and `natom = 8` indicate the number of elements and the number of atoms in the system, respectively.

For Maxwell - TDDFT multi scale calculation (Tutorial-6):

```
&system
  iperiodic = 3
  al = 10.26d0,10.26d0,10.26d0
  isym = 8
  crystal_structure = 'diamond'
  nstate = 32
  nelec = 32
  nelem = 1
  natom = 8
/
```

The difference from the above case is the variables, `isym = 8` and `crystal_structure = 'diamond'`, which indicates that the spatial symmetry of the unit cell is used in the calculation. Although the use of the symmetry substantially reduces the computational cost, it should be used very carefully. At present, the spatial symmetry has been implemented only for the case of the diamond structure.

3.6 &pseudo

Mandatory: `pseudo_file`, `izatom`

For C2H2 molecule:

```
&pseudo
izatom(1)=6
izatom(2)=1
pseudo_file(1)='C_rps.dat'
pseudo_file(2)='H_rps.dat'
lmax_ps(1)=1
lmax_ps(2)=0
lloc_ps(1)=1
lloc_ps(2)=0
/
```

Parameters related to atomic species and pseudopotentials. `izatom(1) = 6` specifies the atomic number of the element #1. `pseudo_file(1) = 'C_rps.dat'` indicates the filename of the pseudopotential of element #1. `lmax_ps(1) = 1` and `lloc_ps(1) = 1` specify the maximum angular momentum of the pseudopotential projector and the angular momentum of the pseudopotential that will be treated as local, respectively.

For crystalline Si:

```
&pseudo
izatom(1)=14
pseudo_file(1) = './Si_rps.dat'
lloc_ps(1)=2
/
```

`izatom(1) = 14` indicates the atomic number of the element #1. `pseudo_file(1) = 'Si_rps.dat'` indicates the pseudopotential filename of element #1. `lloc_ps(1) = 2` indicate the angular momentum of the pseudopotential that will be treated as local.

3.7 &atomic_coor

Mandatory: atomic_coor or atomic_red_coor (they may be provided as a separate file)

For C2H2 molecule:

```
&atomic_coor
'C' 0.000000 0.000000 0.599672 1
'H' 0.000000 0.000000 1.662257 2
'C' 0.000000 0.000000 -0.599672 1
'H' 0.000000 0.000000 -1.662257 2
/
```

Cartesian coordinates of atoms. The first column indicates the element. Next three columns specify Cartesian coordinates of the atoms. The number in the last column labels the element.

3.8 &atomic_red_coor

Mandatory: atomic_coor or atomic_red_coor (they may be provided as a separate file)

For a crystalline silicon:

```
&atomic_red_coor
'Si' .0 .0 .0 1
'Si' .25 .25 .25 1
```

(continues on next page)

(continued from previous page)

```
'Si' .5 .0 .5 1
'Si' .0 .5 .5 1
'Si' .5 .5 .0 1
'Si' .75 .25 .75 1
'Si' .25 .75 .75 1
'Si' .75 .75 .25 1
/
```

Cartesian coordinates of atoms are specified in a reduced coordinate system. First column indicates the element, next three columns specify reduced Cartesian coordinates of the atoms, and the last column labels the element.

3.9 &rgrid

Mandatory: dl or num_rgrid

This namelist provides grid spacing of Cartesian coordinate system. dl (3) specify the grid spacing in three Cartesian coordinates. This is adopted for C2H2 calculation (Tutorial-1).

```
&rgrid
dl = 0.25d0, 0.25d0, 0.25d0
/
```

num_rgrid(3) specify the number of grid points in each Cartesian direction. This is adopted for crystalline Is calculation (Tutorial-4, 5, 6).

```
&rgrid
  num_rgrid = 12,12,12
/
```

3.10 &kgrid

Mandatory: none

This namelist provides grid spacing of k-space for periodic systems.

```
&kgrid
num_kgrid = 4,4,4
/
```

3.11 &scf

Mandatory: nscf

This namelists specify parameters related to the self-consistent field calculation.

```
&scf
  ncg = 4
  nscf = 1000
  convergence = 'norm_rho_dng'
  threshold_norm_rho = 1.d-15
/
```

ncg = 4 is the number of conjugate-gradient iterations in solving the Kohn-Sham equation. Usually this value should be 4 or 5. nscf = 1000 is the number of scf iterations. For isolated systems specified by &system/iperiodic = 0, the scf loop in the ground state calculation ends before the number of the scf iterations reaches nscf, if a convergence criterion is satisfied. There are several options to examine the convergence. If the value of norm_rho_dng is specified, the convergence is examined by the squared difference of the electron density,

3.12 &hartree

Mandatory: none

```
&hartree
  meo = 3
  num_pole_xyz = 2,2,2
/
```

meo specifies the order of multipole expansion of electron density that is used to prepare boundary condition for the Hartree potential.

- meo=1: Monopole expansion (spherical boundary condition).
- meo=2: Multipole expansions around each atom.
- meo=3: Multipole expansion around the center of mass of electrons in cubits that are defined by num_pole_xyz.

num_pole_xyz (3) defines the division of space when meo = 3 is specified.

A default for meo is 3, and defaults for num_pole_xyz are (0, 0, 0). When default is set for num_pole_xyz, the division of space is carried out using a prescribed method.

3.13 &tgrid

Mandatory: dt, Nt

```
&tgrid
  dt=1.25d-3
  nt=5000
/
```

dt=1.25d-3 specifies the time step of the time evolution calculation. nt=5000 specifies the number of time steps in the calculation.

3.14 &propagation

This namelist specifies the numerical method for time evolution calculations of electron orbitals.

```
&propagation
  propagator='etrs'
/
```

propagator = 'etrs' indicates the use of enforced time-reversal symmetry propagator. M.A.L. Marques, A. Castro, G.F. Bertsch, and A. Rubio, Comput. Phys. Commun., 151 60 (2003).

```
&propagation
  propagator='middlepoint'
/
```

`propagation='middlepoint'` indicates that Hamiltonian at midpoint of two-times is used.

The default is *middlepoint*.

3.15 &emfield

This namelist specifies the pulse shape of an electric field applied to the system in time evolution calculations. We explain below separating two cases, *Linear response calculations* and *Pulsed electric field calculations*.

3.15.1 Linear response calculations

A weak impulsive field is applied at $t=0$. For this case, `ae_shape1 = 'impulse'` should be described.

Mandatory: `ae_shape1`

```
&emfield
  ae_shape1 = 'impulse'
  epdir_re1 = 0.d0,0.d0,1.d0
/
```

`epdir_re1(3)` specify a unit vector that indicates the direction of the impulse.

For a periodic system specified by `iperiodic = 3`, one may add `trans_longi`. It has the value, '`tr`'(transverse) or '`lo`'(longitudinal), that specifies the treatment of the polarization in the time evolution calculation. The default is '`tr`'.

```
&emfield
  trans_longi = 'tr'
  ae_shape1 = 'impulse'
  epdir_re1 = 0.,0.,1.
/
```

The magnitude of the impulse of the pulse may be explicitly specified by, for example, `e_impulse = 1d-2`. The default is '1d-2' in atomic unit.

3.15.2 Pulsed electric field calculations

A Pulsed electric field of finite time duration is applied. For this case, `as_shape1` should be specified. It indicates the shape of the envelope of the pulse. The options include 'Acos2' and 'Ecos2' (See below for other options).

Mandatory: `ae_shape1, epdir_re1, {rlaser_int1 or amplitude1}, omega1, pulse_tw1, phi_cep1`

```
&emfield
  ae_shape1 = 'Ecos2'
  epdir_re1 = 0.d0,0.d0,1.d0
  rlaser_int_wcm2_1 = 1.d8
  omega1=9.28d0
  pulse_tw1=6.d0
  phi_cep1=0.75d0
/
```

`ae_shape1 = 'Ecos2'` specifies the envelope of the pulsed electric field, 'Ecos2' for the \cos^2 envelope for the electric field. If 'Acos2' is specified, this gives \cos^2 envelope for the vector potential. Note that 'phi_cep1' must be 0.75 (or 0.25) if one employs 'Ecos2' pulse shape, since otherwise the time integral of the electric field does not vanish. There is no such restriction for the 'Acos2' pulse shape.

`epdir_re1 = 0.d0, 0.d0, 1.d0` specifies the real part of the unit polarization vector of the pulsed electric field. If only the real part is specified, it describes a linearly polarized pulse. Using both real ('epdir_re1') and imaginary ('epdir_im1') parts of the polarization vector, circularly (and general ellipsoidal) polarized pulses may be described.

`laser_int_wcm2_1 = 1.d8` specifies the maximum intensity of the applied electric field in unit of W/cm². It is also possible to specify the maximum intensity of the pulse by `amplitude1`.

`omegal=9.26d0` specifies the average photon energy (frequency multiplied with hbar).

`pulse_tw1=6.d0` specifies the pulse duration. Note that it is not the FWHM but a full duration of the \cos^2 envelope.

`phi_cep1=0.75d0` specifies the carrier envelope phase of the pulse. As noted above, 'phi_cep1' must be 0.75 (or 0.25) if one employs 'Ecos2' pulse shape, since otherwise the time integral of the electric field does not vanish. There is no such restriction for the 'Acos2' pulse shape.

It is possible to use two pulses simultaneously to simulate pump-probe experiments, adding information for two pulses. To specify the second pulse, change from 1 to 2 in the namelist variables, like `ae_shape2`. The time delay between two pulses is specified by the variable '`t1_t2`'.

For a periodic system specified by `iperiodic = 3`, one may add `trans_longi`. It has the value, '`tr`'(transverse) or '`lo`'(longitudinal), that specifies the treatment of the polarization in the time evolution calculation. The default is '`tr`'. For a periodic system, it is also specify 'Acos3', 'Acos4', 'Acos6', 'Acos8' for `ae_shape1`.

3.16 &analysis

Mandatory: none

The following namelists specify whether the output files are created or not after the calculation. In the ground state calculation of isolated systems (Tutorial-1):

```
&analysis
  out_psi = 'y'
  out_dns = 'y'
  out_dos = 'y'
  out_pdos = 'y'
  out_elf = 'y'
/
```

In the time evolution calculation of isolated systems (Tutorial-3):

```
&analysis
  out_dns_rt = 'y'
  out_elf_rt = 'y'
  out_estatic_rt = 'y'
/
```

In the following namelists, variables related to time-frequency Fourier analysis are specified.

```
&analysis
  nenergy=1000
```

(continues on next page)

(continued from previous page)

```
de=0.001
/
```

`nenergy=1000` specifies the number of energy steps, and `de=0.001` specifies the energy spacing in the time-frequency Fourier transformation.

3.17 &multiscale

This namelist specifies information necessary for Maxwell - TDDFT multiscale calculations.

```
&multiscale
  fdtddim = '1D'
  twod_shape = 'periodic'
  nx_m = 4
  ny_m = 1
  hx_m = 250d0
  nxvacl_m = -2000
  nxvacr_m = 256
/
```

`fdtddim` specifies the spatial dimension of the macro system. `fdtddim='1D'` indicates that one-dimensional equation is solved for the macroscopic vector potential.

`nx_m = 4` specifies the number of the macroscopic grid points in for x-direction in the spatial region where the material exists.

`hx_m = 250d0` specifies the grid spacing of the macroscopic grid in x-direction.

`nxvacl_m = -2000` and `nxvacr_m = 256` indicate the number of grid points in the vacuum region, `nxvacl_m` for the left and `nxvacr_m` for the right from the surface of the material.

3.18 ¶llel

When you execute a job with MPI parallelization, you are not required to specify any parameters that describe the assignment of the parallelization; the assignment is carried out automatically. You may also specify the parameters explicitly as below.

Mandatory: none

```
&parallel
  nproc_ob = 1
  nproc_domain = 1,1,1
  nproc_domain_s = 1,1,1
/
```

- `nproc_ob` specifies the number of MPI parallelization to divide the electron orbitals. The default value is 0 (automatic parallelization).
- `nproc_domain` (3) specifies the number of MPI parallelization to divide the spatial grids of the electron orbitals in three Cartesian directions. The default values are (0/0/0) (automatic parallelization).
- `nproc_domain_s` (3) ' specifies the number of MPI parallelization to divide the spatial grids related to the electron density in three Cartesian directions. The default values are (0/0/0) (automatic parallelization).

The following conditions must be satisfied.

- The total number of processors must be equal to both $nproc_ob * nproc_domain(1) * nproc_domain(2) * nproc_domain(3)$ and also $nproc_domain_s(1) * nproc_domain_s(2) * nproc_domain_s(3)$.
- $nproc_domain_s(1)$ is a multiple of $nproc_domain(1)$, and the same relations to the second and third components.

CHAPTER
FOUR

EXERCISES

4.1 Getting started

Welcome to SALMON Exercises!

In these exercises, we explain the use of SALMON from the very beginning, taking a few samples that cover applications of SALMON in several directions. We assume that you are in the computational environment of UNIX/Linux OS. First you need to download and install SALMON in your computational environment. If you have not yet done it, do it following the instruction, [download](#) and [Install and Run](#).

As described in [Install and Run](#), you are required to prepare at least an input file and pseudopotential files to run SALMON. In the following, we present input files for several sample calculations and provide a brief explanation of the namelist variables that appear in the input files. You may modify the input files to execute for your own calculations. Pseudopotential files of elements that appear in the samples are also attached. We also present explanations of main output files.

We present 6 exercises.

First 3 exercises (Exercise-1 ~ 3) are for an isolated molecule, acetylene C₂H₂. If you are interested in learning electron dynamics calculations in isolated systems, please look into these exercises. In SALMON, we usually calculate the ground state solution first. This is illustrated in [Exercise-1](#). After finishing the ground state calculation, two exercises of electron dynamics calculations are prepared. [Exercise-2](#) illustrates the calculation of linear optical responses in real time, obtaining polarizability and photoabsorption of the molecule. [Exercise-3](#) illustrates the calculation of electron dynamics in the molecule under a pulsed electric field.

Next 2 exercises (Exercise-4 ~ 5) are for a crystalline solid, silicon. If you are interested in learning electron dynamics calculations in extended periodic systems, please look into these exercises. Since ground state calculations of small unit-cell systems are not computationally expensive and a time evolution calculation is usually much more time-consuming than the ground state calculation, we recommend to run the ground and the time evolution calculations as a single job. The following two exercises are organized in that way. [Exercise-4](#) illustrates the calculation of linear response properties of crystalline silicon to obtain the dielectric function. [Exercise-5](#) illustrates the calculation of electron dynamics in the crystalline silicon induced by a pulsed electric field.

The final exercise (Exercise-6) is for an irradiation and a propagation of a pulsed light in a bulk silicon, coupling Maxwell equations for the electromagnetic fields of the pulsed light and the electron dynamics in the unit cells. This calculation is quite time-consuming and is recommended to execute using massively parallel supercomputers. [Exercise-6](#) illustrates the calculation of a pulsed, linearly polarized light irradiating normally on a surface of a bulk silicon.

4.2 C₂H₂ (isolated molecules)

4.2.1 Exercise-1: Ground state of C₂H₂ molecule

In this exercise, we learn the calculation of the ground state solution of acetylene (C₂H₂) molecule, solving the static Kohn-Sham equation. This exercise will be useful to learn how to set up calculations in SALMON for any isolated systems such as molecules and nanoparticles. It should be noted that at present it is not possible to carry out the geometry optimization in SALMON. Therefore, atomic positions of the molecule are specified in the input file and are fixed during the calculations.

Input files

To run the code, following files are used:

file name	description
<i>C2H2_gs.inp</i>	input file that contains namelist variables and their values
<i>C_rps.dat</i>	pseudopotential file for carbon atom
<i>H_rps.dat</i>	pseudopotential file for hydrogen atom

You may download the above 3 files (zipped file) from:

https://salmon-tddft.jp/webmanual/v_1_1_0/exercise_zip_files/C2H2_gs_input.zip

(zipped input and pseudopotential files)

In the input file *C2H2_gs.inp*, namelists variables are specified. Most of them are mandatory to execute the ground state calculation. This will help you to prepare an input file for other systems that you want to calculate. A complete list of the namelist variables that can be used in the input file can be found in the downloaded file *SALMON/manual/input_variables.md*.

```
&units
  unit_system='A_eV_fs'
/
&calculation
  calc_mode = 'GS'
/
&control
  sysname = 'C2H2'
/
&system
  iperiodic = 0
  al = 16d0, 16d0, 16d0
  nstate = 5
  nelem = 2
  natom = 4
  nelec = 10
/
&pseudo
  izatom(1)=6
  izatom(2)=1
  pseudo_file(1)='C_rps.dat'
  pseudo_file(2)='H_rps.dat'
  lmax_ps(1)=1
```

(continues on next page)

(continued from previous page)

```

lmax_ps(2)=0
lloc_ps(1)=1
lloc_ps(2)=0
/
&rgrid
  dl = 0.25d0, 0.25d0, 0.25d0
/
&scf
  ncg = 4
  nscf = 1000
  convergence = 'norm_rho_dng'
  threshold_norm_rho = 1.d-15
/
&analysis
  out_psi = 'y'
  out_dos = 'y'
  out_pdos = 'y'
  out_dns = 'y'
  out_elf = 'y'
/
&atomic_coor
'C'    0.000000    0.000000    0.599672    1
'H'    0.000000    0.000000    1.662257    2
'C'    0.000000    0.000000   -0.599672    1
'H'    0.000000    0.000000   -1.662257    2
/

```

We present their explanations below:

Required and recommended variables

&units

Mandatory: none

```

&units
  unit_system='A_eV_fs'
/

```

This namelist specifies the unit system to be used in the input file. If you do not specify it, atomic unit will be used. See [&units in Inputs](#) for detail.

For isolated systems (specified by `iperiodic = 0` in `&system`), the unit of 1/eV is used for the output files of DOS and PDOS if `unit_system = 'A_eV_fs'` is specified, while atomic unit is used if not. For other output files, the Angstrom/eV/fs units are used irrespective of the namelist value.

&calculation

Mandatory: calc_mode

```

&calculation
  calc_mode = 'GS'
/

```

This indicates that the ground state (GS) calculation is carried out in the present job. See [&calculation in Inputs](#) for detail.

&control

Mandatory: none

```
&control
    sysname = 'C2H2'
/
```

'C2H2' defined by sysname = 'C2H2' will be used in the filenames of output files.

&system

Mandatory: iperiodic, al, nstate, nelem, natom

```
&system
    iperiodic = 0
    al = 16d0, 16d0, 16d0
    nstate = 5
    nelem = 2
    natom = 4
    nelec = 10
/
```

iperiodic = 0 indicates that the isolated boundary condition will be used in the calculation. al = 16d0, 16d0, 16d0 specifies the lengths of three sides of the rectangular parallelepiped where the grid points are prepared. nstate = 8 indicates the number of Kohn-Sham orbitals to be solved. nelec = 10 indicate the number of valence electrons in the system. Since the present code assumes that the system is spin saturated, nstate should be equal to or larger than nelec/2. nelem = 2 and natom = 4 indicate the number of elements and the number of atoms in the system, respectively. See [&system in Inputs](#) for more information.

&pseudo

Mandatory: pseudo_file, izatom

```
&pseudo
    izatom(1)=6
    izatom(2)=1
    pseudo_file(1)='C_rps.dat'
    pseudo_file(2)='H_rps.dat'
    lmax_ps(1)=1
    lmax_ps(2)=0
    lloc_ps(1)=1
    lloc_ps(2)=0
/
```

Parameters related to atomic species and pseudopotentials. izatom(1) = 6 specifies the atomic number of the element #1. pseudo_file(1) = 'C_rps.dat' indicates the filename of the pseudopotential of element #1. lmax_ps(1) = 1 and lloc_ps(1) = 1 specify the maximum angular momentum of the pseudopotential projector and the angular momentum of the pseudopotential that will be treated as local, respectively.

&rgrid

Mandatory: dl or num_rgrid

```
&rgrid
    dl = 0.25d0, 0.25d0, 0.25d0
/
```

dl = 0.25d0, 0.25d0, 0.25d0 specifies the grid spacings in three Cartesian directions. See [&rgrid in Inputs](#) for more information.

&scf

Mandatory: nscf

```
&scf
  ncg = 4
  nsdf = 1000
  convergence = 'norm_rho_dng'
  threshold_norm_rho = 1.d-15
/
```

`ncg` is the number of CG iterations in solving the Khon-Sham equation. `nsdf` is the number of scf iterations. For isolated systems specified by `&system/iperiodic = 0`, the scf loop in the ground state calculation ends before the number of the scf iterations reaches `nsdf`, if a convergence criterion is satisfied. There are several options for the convergence check. If the value of `norm_rho_dng` is specified, the convergence is examined by the squared difference of the electron density,

&analysis

The following namelists specify whether the output files are created or not after the calculation.

```
&analysis
  out_psi = 'y'
  out_dos = 'y'
  out_pdos = 'y'
  out_dns = 'y'
  out_elf = 'y'
/
```

&atomic_coor

Mandatory: `atomic_coor` or `atomic_red_coor` (it may be provided as a separate file)

```
&atomic_coor
'C'    0.000000  0.000000  0.599672  1
'H'    0.000000  0.000000  1.662257  2
'C'    0.000000  0.000000 -0.599672  1
'H'    0.000000  0.000000 -1.662257  2
/
```

Cartesian coordinates of atoms. The first column indicates the element. Next three columns specify Cartesian coordinates of the atoms. The number in the last column labels the element.

Output files

After the calculation, following output files are created in the directory that you run the code,

file name	description
<code>C2H2_info.data</code>	information on ground state solution
<code>dns.cube</code>	a cube file for electron density
<code>elf(cube</code>	electron localization function (ELF)
<code>psi1.cube, psi2.cube, ...</code>	electron orbitals
<code>dos.data</code>	density of states
<code>pdos1.data, pdos2.data, ...</code>	projected density of states
<code>C2H2_gs.bin</code>	binary output file to be used in the real-time calculation

You may download the above files (zipped file, except for the binary file `C2H2_gs.bin`) from:

https://salmon-tddft.jp/webmanual/v_1_1_0/exercise_zip_files/C2H2_gs_output.zip

(zipped output files)

Main results of the calculation such as orbital energies are included in *C2H2_info.data*. Explanations of the *C2H2_info.data* and other output files are below:

C2H2_info.data

Calculated orbital and total energies as well as parameters specified in the input file are shown in this file.

```
Total number of iteration = 49
Number of states = 5
Number of electrons = 5
Total energy (eV) = -339.7041368688747
1-particle energies (eV)
    1      -18.4492      2       -13.9884      3       -12.3935      4       -7.3310
    5      -7.3310
Size of the box (A) = 15.99999363 15.99999363 15.99999363
Grid spacing (A) = 0.24999990 0.24999990 0.24999990
Number of atoms = 4
izatom( 1) = 6
izatom( 2) = 1
Ref. and max angular momentum and pseudo-core radius of PP (A)
( 1) Ref, Max, Rps = 1 1 0.800
( 2) Ref, Max, Rps = 0 0 0.800
```

dns.cube

A cube file for electron density. For isolated systems (specified by *iperiodic* = 0 in &system), atomic unit is adopted in all cube files.

elf.cube

A cube file for electron localization function (ELF).

psi1(cube), psi2(cube), ...

Cube files for electron orbitals. The number in the filename indicates the index of the orbital..

dos.data

A file for density of states. The units used in this file are affected by the input parameter, *unit_energy* in &unit.

We show several image that are created from the output files.

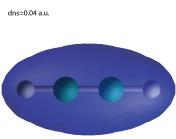

- **Highest occupied molecular orbital (HOMO)**

The output files `psi1(cube), psi2(cube), ...` are used to create the image.

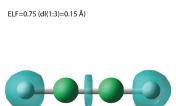

- **Electron density**

The output files `dns(cube), ...` are used to create the image.

- **Electron localization function**

The output files *elf.cube*, ... are used to create the image.

4.2.2 Exercise-2: Polarizability and photoabsorption of C2H2 molecule

In this exercise, we learn the linear response calculation in the acetylene (C_2H_2) molecule, solving the time-dependent Kohn-Sham equation. The linear response calculation provides the polarizability and the oscillator strength distribution of the molecule. This exercise should be carried out after finishing the ground state calculation that was explained in *Exercise-1*. In the calculation, an impulsive perturbation is applied to all electrons in the C_2H_2 molecule along the molecular axis which we take z axis. Then a time evolution calculation is carried out without any external fields. During the calculation, the electric dipole moment is monitored. After the time evolution calculation, a time-frequency Fourier transformation is carried out for the electric dipole moment to obtain the frequency-dependent polarizability. The imaginary part of the frequency-dependent polarizability is proportional to the oscillator strength distribution and the photoabsorption cross section.

Input files

To run the code, the input file *C2H2_rt_response.inp* that contains namelist variables and their values for the linear response calculation is required. The binary file *C2H2_gs.bin* that is created in the ground state calculation and pseudopotential files are also required. The pseudopotential files should be the same as those used in the ground state calculation.

file name	description
<i>C2H2_rt_response.inp</i>	input file that contains namelist variables and their values
<i>C_rps.dat</i>	pseudopotential file for carbon
<i>H_rps.dat</i>	pseudopotential file for hydrogen
<i>C2H2_gs.bin</i>	binary file created in the ground state calculation

You may download the *C2H2_rt_response.inp* file (zipped file) from:

https://salmon-tddft.jp/webmanual/v_1_1_0/exercise_zip_files/C2H2_rt_response_input.zip
(zipped input file)

In the input file *C2H2_rt_response.inp*, namelists variables are specified. Most of them are mandatory to execute the linear response calculation. This will help you to prepare the input file for other systems that you want to calculate. A complete list of the namelist variables that can be used in the input file can be found in the downloaded file *SALMON/manual/input_variables.md*.

/

```

We present their explanations below:

Required and recommended variables

&units

Mandatory: none

```

&units
  unit_system='A_eV_fs'
/

```

This namelist specifies the unit system to be used in the input file. If you do not specify it, atomic unit will be used. See [&units in Inputs](#) for detail.

&calculation

Mandatory: calc_mode

```
&calculation
    calc_mode = 'RT'
/
```

This indicates that the real time (RT) calculation is carried out in the present job. See [&calculation in Inputs](#) for detail.

&control

Mandatory: none

```
&control
    sysname = 'C2H2'
/
```

‘C2H2’ defined by `sysname = ‘C2H2’` will be used in the filenames of output files.

&system

Mandatory: `iperiodic`, `al`, `nstate`, `nelem`, `natom`

```
&system
    iperiodic = 0
    al = 16d0, 16d0, 16d0
    nstate = 5
    nelem = 2
    natom = 4
    nelec = 10
/
```

These namelists and their values should be the same as those used in the ground state calculation. See [&system in Exercise-1](#).

&pseudo

Mandatory: `pseudo_file`, `izatom`

```
&pseudo
    izatom(1)=6
    izatom(2)=1
    pseudo_file(1)='C_rps.dat'
    pseudo_file(2)='H_rps.dat'
    lmax_ps(1)=1
    lmax_ps(2)=0
    lloc_ps(1)=1
    lloc_ps(2)=0
/
```

These namelists and their values should be the same as those used in the ground state calculation. See [&pseudo in Exercise-1](#).

&tgrid

Mandatory: `dt`, `Nt`

```
&tgrid
    dt=1.25d-3
    nt=5000
/
```

`dt=1.25d-3` specifies the time step of the time evolution calculation. `nt=5000` specifies the number of time steps in the calculation.

&emfield

Mandatory: ae_shape1

```
&emfield
  ae_shape1 = 'impulse'
  epdir_re1 = 0.d0,0.d0,1.d0
/
```

ae_shape1 = 'impulse' indicates that a weak impulse is applied to all electrons at $t=0$ epdir_re1 (3) specify a unit vector that indicates the direction of the impulse. See *&emfield in Inputs* for details.

&atomic_coor

Mandatory: atomic_coor or atomic_red_coor (it may be provided as a separate file)

```
&atomic_coor
'C'    0.000000  0.000000  0.599672  1
'H'    0.000000  0.000000  1.662257  2
'C'    0.000000  0.000000 -0.599672  1
'H'    0.000000  0.000000 -1.662257  2
/
```

Cartesian coordinates of atoms. The first column indicates the element. Next three columns specify Cartesian coordinates of the atoms. The number in the last column labels the element. They must be the same as those in the ground state calculation.

Output files

After the calculation, following output files are created in the directory that you run the code,

file name	description
C2H2_lr.data	polarizability and oscillator strength distribution as functions of energy
C2H2_p.data	components of dipole moment as functions of time

You may download the above files (zipped file) from:

[\(zipped output files\)](https://salmon-tddft.jp/webmanual/v_1_1_0/exercise_zip_files/C2H2_rt_response_output.zip)

Explanations of the output files are below:

C2H2-p.data

For time steps from 1 to nt,

- 1 column: time
- 2-4 columns: x,y,z components of the dipole moment
- 5 column: total energy of the system

```
# time[fs],      dipoleMoment(x,y,z) [A],                      Energy[eV]

4.2.3 Exercise-3: Electron dynamics in C2H2 molecule under a pulsed electric field

In this exercise, we learn the calculation of the electron dynamics in the acetylene (C2H2) molecule under a pulsed electric field, solving the time-dependent Kohn-Sham equation. As outputs of the calculation, such quantities as the total energy and the electric dipole moment of the system as functions of time are calculated. This tutorial should be

carried out after finishing the ground state calculation that was explained in *Exercise-1*. In the calculation, a pulsed electric field that has cos² envelope shape is applied. The parameters that characterize the pulsed field such as magnitude, frequency, polarization direction, and carrier envelope phase are specified in the input file.

Input files

To run the code, following files are used. The *C2H2_gs.bin* file is created in the ground state calculation. Pseudopotential files are already used in the ground state calculation. Therefore, *C2H2_rt_pulse.inp* that specifies namelist variables and their values for the pulsed electric field calculation is the only file that the users need to prepare.

file name	description
<i>C2H2_rt_pulse.inp</i>	input file that contain namelist variables and their values.
<i>C_rps.dat</i>	pseudopotential file for Carbon
<i>H_rps.dat</i>	pseudopotential file for Hydrogen
<i>C2H2_gs.bin</i>	binary file created in the ground state calculation

You may download the *C2H2_rt_pulse.inp* file (zipped file) from:

https://salmon-tddft.jp/webmanual/v_1_1_0/exercise_zip_files/C2H2_rt_pulse_input.zip

In the input file *C2H2_rt_pulse.inp*, namelists variables are specified. Most of them are mandatory to execute the calculation of electron dynamics induced by a pulsed electric field. This will help you to prepare the input file for other systems and other pulsed electric fields that you want to calculate. A complete list of the namelist variables that can be used in the input file can be found in the downloaded file *SALMON/manual/input_variables.md*.

'H'    0.000000  0.000000 -1.662257  2
/

```

We present explanations of the namelist variables that appear in the input file below:

required and recommended variables

&units

Mandatory: none

```

&units
  unit_system='A_eV_fs'
/

```

This namelist specifies the unit system to be used in the input file. If you do not specify it, atomic unit will be used. See [&units in Inputs](#) for detail.

&calculation

Mandatory: calc_mode

```

&calculation
  calc_mode = 'RT'
/

```

This indicates that the real time (RT) calculation is carried out in the present job. See [&calculation in Inputs](#) for detail.

&control

Mandatory: none

```

&control
  sysname = 'C2H2'
/

```

'C2H2' defined by sysname = 'C2H2' will be used in the filenames of output files.

&system

Mandatory: iperiodic, al, nstate, nelem, natom

```

&system
  iperiodic = 0
  al = 16d0, 16d0, 16d0

```

(continues on next page)

(continued from previous page)

```
nstate = 5
nelem = 2
natom = 4
nelec = 10
/
```

These namelists and their values should be the same as those used in the ground state calculation. See [&system in Exercise-1](#).

&pseudo

Mandatory: pseudo_file, izatom

```
&pseudo
izatom(1)=6
izatom(2)=1
pseudo_file(1)='C_rps.dat'
pseudo_file(2)='H_rps.dat'
lmax_ps(1)=1
lmax_ps(2)=0
lloc_ps(1)=1
lloc_ps(2)=0
/
```

These namelists and their values should be the same as those used in the ground state calculation. See [&pseudo in Exercise-1](#).

&tgrid

Mandatory: dt, Nt

```
&tgrid
dt=1.25d-3
nt=4800
/
```

`dt=1.25d-3` specifies the time step of the time evolution calculation. `Nt=4800` specifies the number of time steps in the calculation.

&emfield

Mandatory: ae_shape1, epdir_re1, {rlaser_int1 or amplitude1}, omega1, pulse_tw1, phi_cep1

```
&emfield
ae_shape1 = 'Ecos2'
epdir_re1 = 0.d0,0.d0,1.d0
rlaser_int_wcm2_1 = 1.d8
omega1=9.28d0
pulse_tw1=6.d0
phi_cep1=0.75d0
/
```

`ae_shape1 = 'Ecos2'` indicates that the envelope of the pulsed electric field has a \cos^2 shape.

`epdir_re1 = 0.d0,0.d0,1.d0` specifies the real part of the unit polarization vector of the pulsed electric field. Using the real polarization vector, it describes a linearly polarized pulse.

`laser_int_wcm2_1 = 1.d8` specifies the maximum intensity of the applied electric field in unit of W/cm².

`omega1=9.26d0` specifies the average photon energy (frequency multiplied with hbar).

pulse_tw1=6.d0 specifies the pulse duration. Note that it is not the FWHM but a full duration of the cos^2 envelope.

phi_cepl=0.75d0 specifies the carrier envelope phase of the pulse. As noted above, ‘phi_cepl’ must be 0.75 (or 0.25) if one employs ‘Ecos2’ pulse shape, since otherwise the time integral of the electric field does not vanish.

See *&emfield in Inputs* for details.

&atomic_coor

Mandatory: atomic_coor or atomic_red_coor (it may be provided as a separate file)

```
&atomic_coor
'C'    0.000000   0.000000   0.599672   1
'H'    0.000000   0.000000   1.662257   2
'C'    0.000000   0.000000  -0.599672   1
'H'    0.000000   0.000000  -1.662257   2
/
```

Cartesian coordinates of atoms. The first column indicates the element. Next three columns specify Cartesian coordinates of the atoms. The number in the last column labels the element. They must be the same as those in the ground state calculation.

Output files

After the calculation, following output files are created in the directory that you run the code,

file name	description
C2H2_p.data	components of the electric dipole moment as functions of time
C2H2_ps.data	power spectrum that is obtained by a time-frequency Fourier transformation of the electric dipole moment

You may download the above files (zipped file) from:

https://salmon-tddft.jp/webmanual/v_1_1_0/exercise_zip_files/C2H2_rt_pulse_output.zip

Explanations of the files are described below:

C2H2_p.data

For time steps from 1 to nt,

- 1 column: time
- 2-4 columns: x,y,z components of the dipole moment
- 5 column: total energy of the system

4.3 Crystalline silicon (periodic solids)

4.3.1 Exercise-4: Dielectric function of crystalline silicon

In this exercise, we learn the linear response calculation of the crystalline silicon of a diamond structure. Calculation is done in a cubic unit cell that contains eight silicon atoms. Since the ground state calculation costs much less computational time than the time evolution calculation, both calculations are successively executed. After finishing the ground state calculation, an impulsive perturbation is applied to all electrons in the unit cell along z direction. Since

the dielectric function is isotropic in the diamond structure, calculated dielectric function should not depend on the direction of the perturbation. During the time evolution, electric current averaged over the unit cell volume is calculated. A time-frequency Fourier transformation of the electric current gives us a frequency-dependent conductivity. The dielectric function may be obtained from the conductivity using a standard relation.

Input files

To run the code, following files are used:

file name	description
<i>Si_gs_rt_response.inp</i>	input file that contain namelist variables and their values.
<i>Si_rps.dat</i>	pseudopotential file of silicon

You may download the above 2 files (zipped file) from:

https://salmon-tddft.jp/webmanual/v_1_1_0/exercise_zip_files/Si_gs_rt_response_input.zip

In the input file *Si_gs_rt_response.inp*, namelists variables are specified. Most of them are mandatory to execute the calculation. This will help you to prepare the input file for other systems that you want to calculate. A complete list of the namelist variables that can be used in the input file can be found in the downloaded file *SALMON/manual/input_variables.md*.

```

&calculation
  calc_mode = 'GS_RT'

  'Si'      .25     .25     .25     1
  'Si'      .5       .0      .5      1
  'Si'      .0       .5      .5      1
  'Si'      .5       .5      .0      1
  'Si'      .75     .25     .75     1
  'Si'      .25     .75     .75     1
  'Si'      .75     .75     .25     1
/

```

We present explanations of the namelist variables that appear in the input file below:

&calculation

Mandatory: calc_mode

```

&calculation
  calc_mode = 'GS_RT'
/

```

This indicates that the ground state (GS) and the real time (RT) calculations are carried out sequentially in the present job. See *&calculation in Inputs* for detail.

&control

Mandatory: none

```

&control
  sysname = 'Si'
/

```

'Si' defined by sysname = 'C2H2' will be used in the filenames of output files.

&system

Mandatory: periodic, al, state, nelem, natom

```

&system
  iperiodic = 3

```

(continues on next page)

(continued from previous page)

```
a1 = 10.26d0,10.26d0,10.26d0
nstate = 32
nelec = 32
nelem = 1
natom = 8
/
```

`iperiodic = 3` indicates that three dimensional periodic boundary condition (bulk crystal) is assumed. `a1 = 10.26d0, 10.26d0, 10.26d0` specifies the lattice constants of the unit cell. `nstate = 32` indicates the number of Kohn-Sham orbitals to be solved. `nelec = 32` indicate the number of valence electrons in the system. `nelem = 1` and `natom = 8` indicate the number of elements and the number of atoms in the system, respectively. See [&system in Inputs](#) for more information.

&pseudo

```
&pseudo
izatom(1)=14
pseudo_file(1) = './Si_rps.dat'
lloc_ps(1)=2
/
```

`izatom(1) = 14` indicates the atomic number of the element #1. `pseudo_file(1) = 'Si_rps.dat'` indicates the pseudopotential filename of element #1. `lloc_ps(1) = 2` indicate the angular momentum of the pseudopotential that will be treated as local.

&functional

```
&functional
xc = 'PZ'
/
```

This indicates that the adiabatic local density approximation with the Perdew-Zunger functional is used. We note that meta-GGA functionals that reasonably reproduce the band gap of various insulators may also be used in the calculation of periodic systems. See [&functional in Inputs](#) for detail.

&rgrid

Mandatory: dl or num_rgrid

```
&rgrid
num_rgrid = 12,12,12
/
```

`num_rgrid=12,12,12` specifies the number of the grids for each Cartesian direction. See [&rgrid in Inputs](#) for more information.

&kgrid

Mandatory: none

This namelist provides grid spacing of k-space for periodic systems.

```
&kgrid
num_kgrid = 4,4,4
/
```

&tgrid

```
&tgrid
  nt=3000
  dt=0.16
/
```

`dt=0.16` specifies the time step of the time evolution calculation. `nt=3000` specifies the number of time steps in the calculation.

&propagation

```
&propagation
  propagator='etrs'
/
```

`propagator = 'etrs'` indicates the use of enforced time-reversal symmetry propagator. See *&propagation in Inputs* for more information.

&scf

Mandatory: `nscf`

This namelists specify parameters related to the self-consistent field calculation.

```
&scf
  ncg = 5
  nscf = 120
/
```

`ncg = 5` is the number of conjugate-gradient iterations in solving the Kohn-Sham equation. Usually this value should be 4 or 5. `nscf = 120` is the number of scf iterations.

&emfield

Mandatory:`ae_shape1`

```
&emfield
  trans_longi = 'tr'
  ae_shape1 = 'impulse'
  epdir_re1 = 0.,0.,1.
/
```

`as_shape1 = 'impulse'` indicates that a weak impulsive field is applied to all electrons at $t=0$

`epdir_re1(3)` specify a unit vector that indicates the direction of the impulse.

`trans_longi = 'tr'` specifies the treatment of the polarization in the time evolution calculation, transverse for 'tr' and longitudinal for 'lo'.

See *&emfield in Inputs* for detail.

&analysis

```
&analysis
  nenergy=1000
  de=0.001
/
```

`nenergy=1000` specifies the number of energy steps, and `de=0.001` specifies the energy spacing in the time-frequency Fourier transformation.

&atomic_red_coor

Mandatory: atomic_coor or atomic_red_coor (they may be provided as a separate file)

```
&atomic_red_coor
'Si'    .0      .0      .0      1
'Si'    .25     .25     .25     1
'Si'    .5      .0      .5      1
'Si'    .0      .5      .5      1
'Si'    .5      .5      .0      1
'Si'    .75     .25     .75     1
'Si'    .25     .75     .75     1
'Si'    .75     .75     .25     1
/
```

Cartesian coordinates of atoms are specified in a reduced coordinate system. First column indicates the element, next three columns specify reduced Cartesian coordinates of the atoms, and the last column labels the element.

Output files

After the calculation, following output files are created in the directory that you run the code,

file name	description
<i>Si_gs_info.data</i>	information of ground state calculation
<i>Si_eigen.data</i>	energy eigenvalues of orbitals
<i>Si_k.data</i>	information on k-points
<i>Si_rt.data</i>	electric field, vector potential, and current as functions of time
<i>Si_force.data</i>	force acting on atoms
<i>Si_lr.data</i>	Fourier spectra of the dielectric functions
<i>Si_gs_rt_response.out</i>	standard output file

You may download the above files (zipped file) from:

https://salmon-tddft.jp/webmanual/v_1_1_0/exercise_zip_files/Si_gs_rt_response_output.zip

Explanations of the output files are described below:

Si_gs_info.data

Results of the ground state as well as input parameters are provided.

Si_rt.data

Results of time evolution calculation. $Ac_{ext,x,y,z}$ are applied vector potential. For transverse calculation specified by `trans_longi = 'tr'`, $Ac_{tot,x,y,z}$ are equal to $Ac_{ext,x,y,z}$. For longitudinal calculation specified by `trans_longi = 'lo'`, $Ac_{tot,x,y,z}$ are the sum of $Ac_{ext,x,y,z}$ and the induced polarization. The same relation holds for electric fields of $E_{ext,x,y,z}$ and $E_{tot,x,y,z}$. $Jm_{x,y,z}$ are macroscopic current. $Eall$ and $Eall-Eall0$ are total energy and electronic excitation energy, respectively. ‘Tion’ is the kinetic energy of atoms. $Temperature_{ion}$ is the temperature estimated from the atomic motion.

```

```

Si_lr_data

In transverse calculation specified by `trans_longi = 'tr'`, time-frequency Fourier transformation of the macroscopic current gives the conductivity of the system. Then the dielectric function is calculated.

```

Si_gs_rt_response.out

Standard output file.

4.3.2 Exercise-5: Electron dynamics in crystalline silicon under a pulsed electric field

In this exercise, we learn the calculation of electron dynamics in a unit cell of crystalline silicon of a diamond structure. Calculation is done in a cubic unit cell that contains eight silicon atoms. Since the ground state calculation costs much less computational time than the time evolution calculation, both calculations are successively executed. After finishing the ground state calculation, a pulsed electric field that has \cos^2 envelope shape is applied. The parameters that characterize the pulsed field such as magnitude, frequency, polarization, and carrier envelope phase are specified in the input file.

Input files

To run the code, following files are used:

file name	description
<i>Si_gs_rt_pulse.inp</i>	input file that contain namelist variables and their values.
<i>Si_rps.dat</i>	pseudopotential file for Carbon

You may download the above 2 files (zipped file) from:

https://salmon-tddft.jp/webmanual/v_1_1_0/exercise_zip_files/Si_gs_rt_pulse_input.zip

In the input file *Si_gs_rt_pulse.inp*, namelists variables are specified. Most of them are mandatory to execute the calculation. This will help you to prepare the input file for other systems that you want to calculate. A complete list of the namelist variables that can be used in the input file can be found in the downloaded file *SALMON/manual/input_variables.md*.

```

We present explanations of the namelist variables that appear in the input file below:

XXXX hoge input exe5 XXXXX

&calculation

Mandatory: calc_mode

```

&calculation
  calc_mode = 'GS_RT'
/

```

This indicates that the ground state (GS) and the real time (RT) calculations are carried out sequentially in the present job. See [&calculation in Inputs](#) for detail.

&control

Mandatory: none

```

&control
  sysname = 'Si'
/

```

‘Si’ defined by sysname = ‘C2H2’ will be used in the filenames of output files.

&system

Mandatory: periodic, al, state, nelem, natom

```
&system
  iperiodic = 3
  al = 10.26d0,10.26d0,10.26d0
  nstate = 32
  nelec = 32
  nelem = 1
  natom = 8
/
```

iperiodic = 3 indicates that three dimensional periodic boundary condition (bulk crystal) is assumed. al = 10.26d0, 10.26d0, 10.26d0 specifies the lattice constants of the unit cell. nstate = 32 indicates the number of Kohn-Sham orbitals to be solved. nelec = 32 indicate the number of valence electrons in the system. nelem = 1 and natom = 8 indicate the number of elements and the number of atoms in the system, respectively. See [&system Inputs](#) for more information.

&pseudo

```
&pseudo
  izatom(1)=14
  pseudo_file(1) = './Si_rps.dat'
  lloc_ps(1)=2
/
```

izatom(1) = 14 indicates the atomic number of the element #1. pseudo_file(1) = 'Si_rps.dat' indicates the pseudopotential filename of element #1. lloc_ps(1) = 2 indicate the angular momentum of the pseudopotential that will be treated as local.

&functional

```
&functional
  xc = 'PZ'
/
```

This indicates that the adiabatic local density approximation with the Perdew-Zunger functional is used. We note that meta-GGA functionals that reasonably reproduce the band gap of various insulators may also be used in the calculation of periodic systems. See [&functional in Inputs](#) for detail.

&rgrid

Mandatory: dl or num_rgrid

```
&rgrid
  num_rgrid = 12,12,12
/
```

num_rgrid=12,12,12 specifies the number of grids for each Cartesian direction. See [&rgrid in Inputs](#) for more information.

&kgrid

Mandatory: none

This namelist provides grid spacing of k-space for periodic systems.

```
&kgrid
  num_kgrid = 4, 4, 4
/
```

&tgrid

```
&tgrid
  nt=3000
  dt=0.16
/
```

dt=0.16 specifies the time step of the time evolution calculation. nt=3000 specifies the number of time steps in the calculation.

&propagation

```
&propagation
  propagator='etrs'
/
```

propagator = 'etrs' indicates the use of enforced time-reversal symmetry propagator. See [&propagation in Inputs](#) for more information.

&scf

Mandatory: nscf

This namelists specify parameters related to the self-consistent field calculation.

```
&scf
  ncg = 5
  nscf = 120
/
```

ncg = 5 is the number of conjugate-gradient iterations in solving the Kohn-Sham equation. Usually this value should be 4 or 5. nscf = 120 is the number of scf iterations.

&emfield

```
&emfield
  trans_longi = 'tr'
  ae_shape1 = 'Acos2'
  rlaser_int_wcm2_1 = 1d14
  pulse_tw1 = 441.195136248d0
  omega1 = 0.05696145187d0
  epdir_rel = 0.,0.,1.
/
```

This namelist specifies the pulsed electric field applied to the system

ae_shape1 = 'Acos2' specifies the envelope of the pulsed electric field, cos^2 envelope for the vector potential.
epdir_rel = 0.,0.,1. specify the real part of the unit polarization vector of the pulsed electric field. Specifying only the real part, it describes a linearly polarized pulse.

laser_int_wcm2_1 = 1d14 specifies the maximum intensity of the applied electric field in unit of W/cm^2.

omega1=0.05696145187d0 specifies the average photon energy (frequency multiplied with hbar).

pulse_tw1=441.195136248d0 specifies the pulse duration. Note that it is not the FWHM but a full duration of the cos^2 envelope.

`trans_longi = 'tr'` specifies the treatment of the polarization in the time evolution calculation, 'tr' indicating transverse.

See `&emfield` in *Inputs* for detail.

&atomic_red_coor

Mandatory: atomic_coor or atomic_red_coor (they may be provided as a separate file)

```
&atomic_red_coor
'Si'    .0      .0      .0      1
'Si'    .25     .25     .25     1
'Si'    .5      .0      .5      1
'Si'    .0      .5      .5      1
'Si'    .5      .5      .0      1
'Si'    .75     .25     .75     1
'Si'    .25     .75     .75     1
'Si'    .75     .75     .25     1
/
```

Cartesian coordinates of atoms are specified in a reduced coordinate system. First column indicates the element, next three columns specify reduced Cartesian coordinates of the atoms, and the last column labels the element.

Output files

After the calculation, following output files are created in the directory that you run the code,

file name	description
<i>Si_gs_info.data</i>	information of ground state calculation
<i>Si_eigen.data</i>	energy eigenvalues of orbitals
<i>Si_k.data</i>	information on k-points
<i>Si_rt.data</i>	electric field, vector potential, and current as functions of time
<i>Si_force.data</i>	force acting on atoms
<i>Si_lr.data</i>	Fourier transformations of various quantities
<i>Si_gs_rt_pulse.out</i>	standard output file

You may download the above files (zipped file) from:

https://salmon-tddft.jp/webmanual/v_1_1_0/exercise_zip_files/Si_gs_rt_pulse_output.zip

Explanations of the output files are described below:

Si_gs_info.data

Results of the ground state as well as input parameters are provided.

Si_rt.data

Results of time evolution calculation. $Ac_{ext,x,y,z}$ are applied vector potential. For transverse calculation specified by `trans_longi = 'tr'`, $Ac_{tot,x,y,z}$ are equal to $Ac_{ext,x,y,z}$. For longitudinal calculation specified by `trans_longi = 'lo'`, $Ac_{tot,x,y,z}$ are the sum of $Ac_{ext,x,y,z}$ and the induced polarization. The same relation holds for electric fields of $E_{ext,x,y,z}$ and $E_{tot,x,y,z}$. $Jm_{x,y,z}$ are macroscopic current. $Eall$ and $Eall-Eall0$ are total energy and electronic excitation energy, respectively. ‘Tion’ is the kinetic energy of atoms. $Temperature_{ion}$ is the temperature estimated from the atomic motion.

Si_gs_rt_pulse.out

Standard output file.

4.4 Maxwell + TDDFT multiscale simulation

4.4.1 Exercise-6: Pulsed-light propagation through a silicon thin film

In this exercise, we learn the calculation of the propagation of a pulsed light through a thin film of crystalline silicon. We consider a silicon thin film of 53 nm thickness, and an irradiation of a few-cycle, linearly polarized pulsed light normally on the thin film. First, to set up initial orbitals, the ground state calculation is carried out. The pulsed light locates in the vacuum region in front of the thin film. The parameters that characterize the pulsed light such as magnitude and frequency are specified in the input file. The calculation ends when the reflected and transmitted pulses reach the vacuum region.

Input files

To run the code, following files are used:

file name	description
<i>Si_gs_rt_multiscale.inp</i>	input file that contain namelist variables and their values.
<i>Si_rps.dat</i>	pseudopotential file for silicon

You may download the above two files (zipped file) from:

https://salmon-tddft.jp/webmanual/v_1_1_0/exercise_zip_files/Si_gs_rt_multiscale_input.zip

In the input file *Si_gs_rt_multiscale.inp*, namelists variables are specified. Most of them are mandatory to execute the calculation. This will help you to prepare the input file for other systems that you want to calculate. A complete list of the namelist variables that can be used in the input file can be found in the downloaded file *SALMON/manual/input_variables.md*.

'Si'      .75     .75     .25     1
/
```

We present explanations of the namelist variables that appear in the input file below:

&calculation

Mandatory: calc_mode

```
&calculation
  calc_mode = 'GS_RT'
  use_ms_maxwell = 'y'
/
```

calc_mode = 'GS_RT' indicates that the ground state (GS) and the real time (RT) calculations are carried out sequentially in the present job. use_ms_maxwell = 'y' indicates the multi-scale Maxwell - TDDFT calculation. See [&calculation in Inputs](#) for detail.

&control

Mandatory: none

```
&control
  sysname = 'Si'
/
```

'Si' defined by sysname = 'C2H2' will be used in the filenames of output files.

&system

```
&system
  iperiodic = 3
  al = 10.26d0,10.26d0,10.26d0
  isym = 8
  crystal_structure = 'diamond'
  nstate = 32
  nelec = 32
  nelem = 1
  natom = 8
/
```

iperiodic = 3 indicates that three dimensional periodic boundary condition (bulk crystal) is assumed. al = 10.26d0, 10.26d0, 10.26d0 specifies the lattice constants of the unit cell. nstate = 32 indicates the number of Kohn-Sham orbitals to be solved. nelec = 32 indicate the number of valence electrons in the system. nelem = 1 and natom = 8 indicate the number of elements and the number of atoms in the system, respectively. isym = 8 and crystal_structure = 'diamond', which indicates that the spatial symmetry of the unit cell is used in the calculation. Although the use of the symmetry substantially reduces the computational cost, it should be used very carefully. At present, the spatial symmetry has been implemented only for the case of the diamond structure. See [&system in Inputs](#) for more information.

&pseudo

```
&pseudo
  izatom(1)=14
  pseudo_file(1) = './Si_rps.dat'
```

(continues on next page)

(continued from previous page)

```
1loc_ps(1)=2
/
```

`izatom(1) = 14` indicates the atomic number of the element #1. `pseudo_file(1) = 'Si_rps.dat'` indicates the pseudopotential filename of element #1. `1loc_ps(1) = 2` indicate the angular momentum of the pseudopotential that will be treated as local.

&functional

```
&functional
  xc='PZ'
/
```

This indicates that the adiabatic local density approximation with the Perdew-Zunger functional is used. We note that meta-GGA functionals that reasonably reproduce the band gap of various insulators may also be used in the calculation of periodic systems. See [&functional in Inputs](#) for detail.

&rgrid

Mandatory: dl or num_rgrid

```
&rgrid
  num_rgrid = 12,12,12
/
```

`num_rgrid=12,12,12` specifies the number of the grids for each Cartesian direction. See [&rgrid in Inputs](#) for more information.

&kgrid

Mandatory: none

This namelist provides grid spacing of k-space for periodic systems.

```
&kgrid
  num_kgrid = 2,2,2
/
```

&tgrid

```
&tgrid
  nt=4000
  dt=0.08
/
```

`dt=0.08` specifies the time step of the time evolution calculation. `nt=4000` specifies the number of time steps in the calculation.

&propagation

```
&propagation
  propagator='middlepoint'
/
```

`propagator = 'middlepoint'` indicates that Hamiltonian at midpoint of two-times is used. See [&propagation in Inputs](#) for more information.

&scf

Mandatory: nscf

This namelists specify parameters related to the self-consistent field calculation.

```
&scf
  ncg = 5
  nscf = 120
/
```

ncg = 5 is the number of conjugate-gradient iterations in solving the Kohn-Sham equation. Usually this value should be 4 or 5. nscf = 120 is the number of scf iterations.

&emfield

```
&emfield
  ae_shape1 = 'Acos2'
  rlaser_int_wcm2_1 = 1d12
  pulse_tw1 = 441.195136248d0
  omega1 = 0.05696145187d0
  epdir_re1 = 0.,0.,1.
/
```

This namelist specifies the pulsed electric field applied to the system

ae_shape1 = 'Acos2' specifies the envelope of the pulsed electric field, cos^2 envelope for the vector potential.
epdir_re1 = 0.,0.,1. specify the real part of the unit polarization vector of the pulsed electric field. Specifying only the real part, it describes a linearly polarized pulse.

laser_int_wcm2_1 = 1d12 specifies the maximum intensity of the applied electric field in unit of W/cm^2.

omega1=0.05696145187d0 specifies the average photon energy (frequency multiplied with hbar).

pulse_tw1=441.195136248d0 specifies the pulse duration. Note that it is not the FWHM but a full duration of the cos^2 envelope.

See *&emfield in Inputs* for detail.

&multiscale

This namelist specifies information necessary for Maxwell - TDDFT multiscale calculations.

```
&multiscale
  fdtddim = '1D'
  twod_shape = 'periodic'
  nx_m = 4
  ny_m = 1
  hx_m = 250d0
  nxvac1_m = -2000
  nxvacr_m = 256
/
```

fdtddim specifies the spatial dimension of the macro system. fdtddim='1D' indicates that one-dimensional equation is solved for the macroscopic vector potential.

nx_m = 4 specifies the number of the macroscopic grid points in for x-direction in the spatial region where the material exists.

hx_m = 250d0 specifies the grid spacing of the macroscopic grid in x-direction.

nxvac1_m = -2000 and nxvacr_m = 256 indicate the number of grid points in the vacuum region, nxvac1_m for the left and nxvacr_m for the right from the surface of the material.

&atomic_red_coor

Mandatory: atomic_coor or atomic_red_coor (they may be provided as a separate file)

```
&atomic_red_coor
'Si'    .0     .0     .0     1
'Si'    .25    .25    .25    1
'Si'    .5     .0     .5     1
'Si'    .0     .5     .5     1
'Si'    .5     .5     .0     1
'Si'    .75    .25    .75    1
'Si'    .25    .75    .75    1
'Si'    .75    .75    .25    1
/
```

Cartesian coordinates of atoms are specified in a reduced coordinate system. First column indicates the element, next three columns specify reduced Cartesian coordinates of the atoms, and the last column labels the element.

Output files

After the calculation, new directory *multiscale/* is created, then, following output files are created in the directory,

file name	description
<i>Si_gs_info.data</i>	results of the ground state as well as input parameters
<i>Si_eigen.data</i>	orbital energies in the ground state calculation
<i>Si_k.data</i>	information on k-points
<i>RT_Ac/Si_Ac_xxxxxx.data</i>	various quantities at a time as functions of macroscopic position
<i>RT_Ac/Si_Ac_vac.data</i>	vector potential at vacuum position adjacent to the medium
<i>Mxxxxxx/Si_Ac_M.data</i>	various quantities at a macroscopic point as functions of time
<i>Si_gs_rt_multiscale.out</i>	standard output file

You may download the above files (zipped file) from:

https://salmon-tddft.jp/webmanual/v_1_1_0/exercise_zip_files/Si_gs_rt_multiscale_output.zip

Explanations of the output files are described below:

Si_gs_info.data

Results of the ground state as well as input parameters are provided.

RT_Ac/Si_Ac_00000.data

The number in the file name specifies the iteration number. Various quantities at a time are shown as function of macroscopic position.

- column 1-3: grid number of macroscopic coordinate in 3D format.
- column 4-6: macroscopic vector potential
- column 7-9: macroscopic electric field
- column 10-12: macroscopic magnetic field
- column 13-15: macroscopic current
- column 16: electronic excitation energy per unit cell
- column 17: energy absorbed by electrons per unit cell
- column 18: energy of macroscopic electromagnetic fields per unit cell

```

M00001/Si_Ac_M.data

The number in the file name specifies the macroscopic grid point in a medium. Various quantities at a macroscopic point are shown as functions of time.

```

# Local variable at macro point
# Macropoint:      1      1      1
# Jm: Matter current density
# Ac: External vector potential field
