# Flowchart and equations for isolated systems

GS (Ground State) calculation  
(determination of initial states)

RT (Real-time) calculation  
(propagation of states)

- Ground state calculation

$$\left\{ -\frac{1}{2} \nabla^2 + V_{ion} + V_H + V_{xc} \right\} \psi_n(\mathbf{r}) = \epsilon_n \psi_n(\mathbf{r})$$

$\psi_n$ : Kohn-Sham orbital

$V_H$ : Hartree potential

$\epsilon_n$ : 1-particle energy

$V_{xc}$ : Exchange-correlation potential

$V_{ion}$ : Electron-nuclear interaction potential

- Time evolution calculation

$$i\hbar \frac{\partial}{\partial t} \psi_n(\mathbf{r}, t) = \left\{ -\frac{1}{2} \nabla^2 + V_{ext}(\mathbf{r}, t) + V_{ion} + V_H + V_{xc} \right\} \psi_n(\mathbf{r}, t)$$

$V_{ext}(\mathbf{r}, t)$ : External scalar potential

# Optical response calculation

- Impulsive force

$$V_{ext}(t) = V_0 \delta(t)$$

- Dipole moment

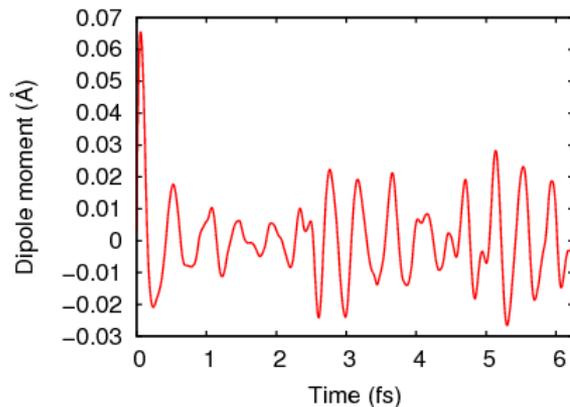

$$d(t) = -e \int r_v (\rho(\mathbf{r}, t) - \rho(\mathbf{r}, 0)) d\mathbf{r}$$

- Oscillator strength function

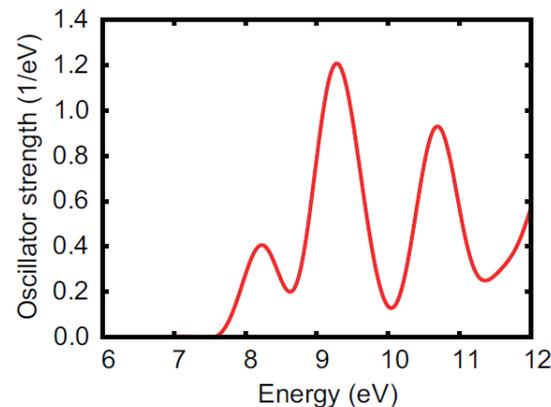

$$\frac{df_v(E)}{dE} = \frac{2mE}{\pi\hbar^3} \text{Im} \int_0^T f\left(\frac{t}{T}\right) d(t) e^{iEt/\hbar} dt$$

C<sub>2</sub>H<sub>2</sub> molecule

- Dipole moment

- Oscillator strength function

# Pulse calculation

- External field

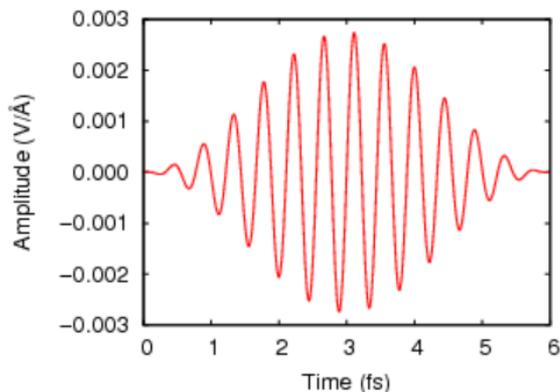

$$V_{ext}(t) = E_0 \cos^2\left(\frac{\pi(t-t_0)}{T}\right) \cos(\omega t + \phi)$$

- Dipole moment

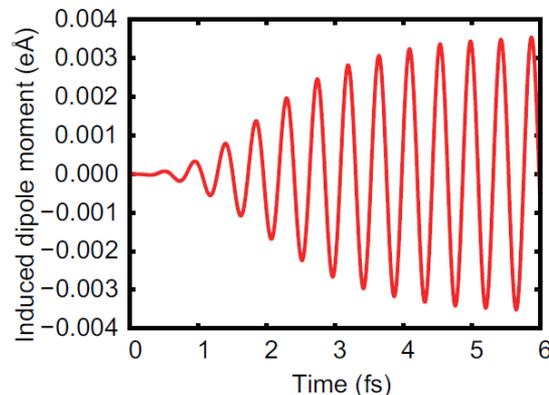

$$d(t) = -e \int r_v (\rho(\mathbf{r}, t) - \rho(\mathbf{r}, 0)) d\mathbf{r}$$

The C<sub>2</sub>H<sub>2</sub> molecule under a laser pulse ( $\omega = 9.28\text{eV}$ )

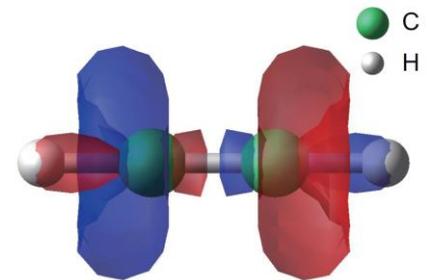

- Shape of pulse

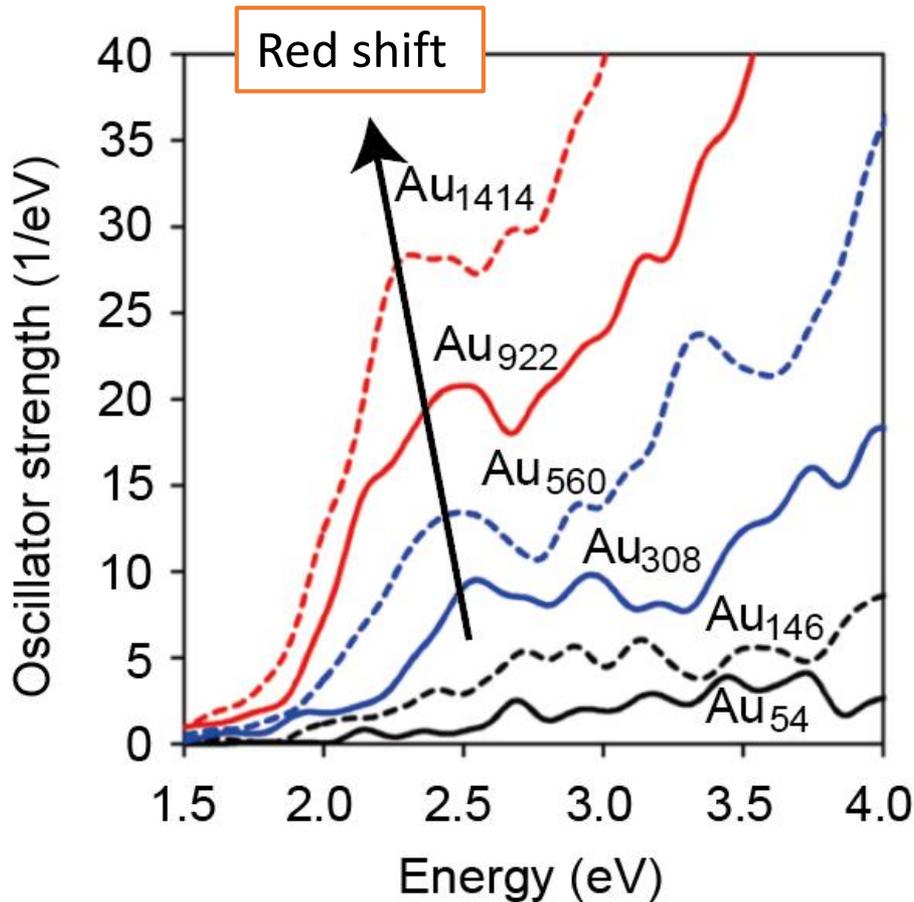

- Dipole moment

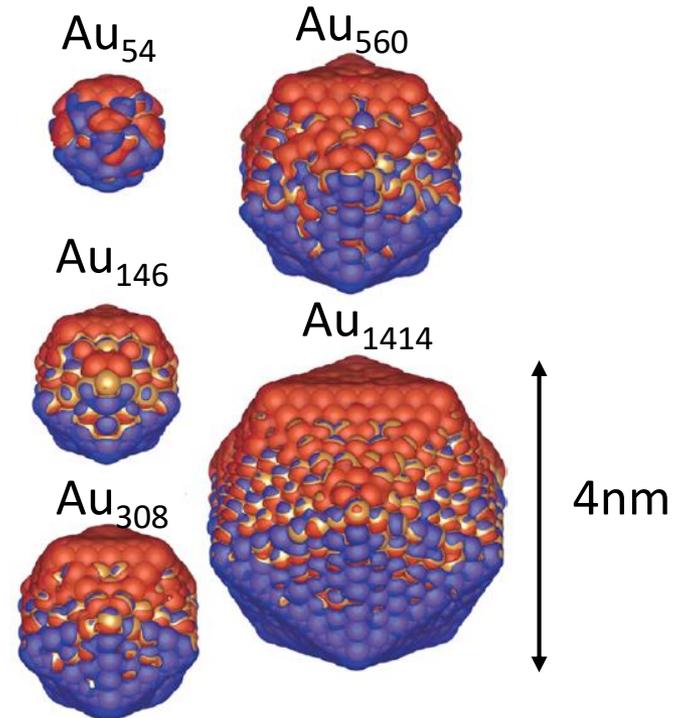

- Difference of electron density

# Applications (1): gold nanocluster

Difference of electron density

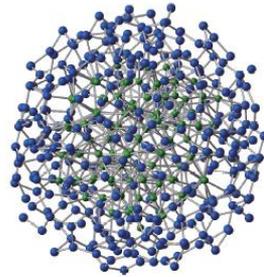

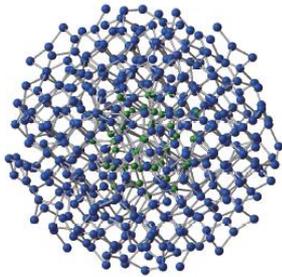

Localized surface plasmon resonance gradually grows with increasing cluster size.

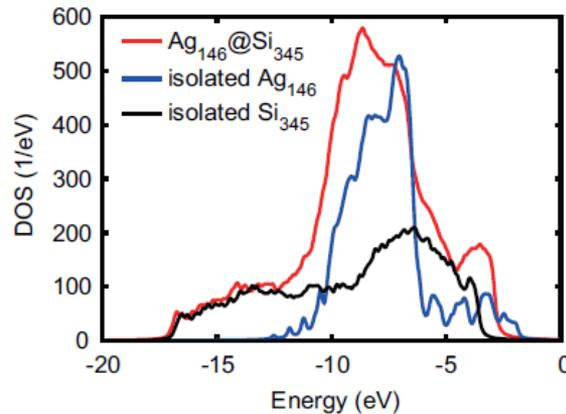

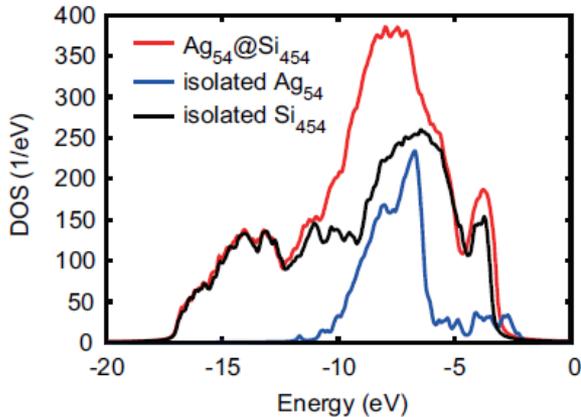

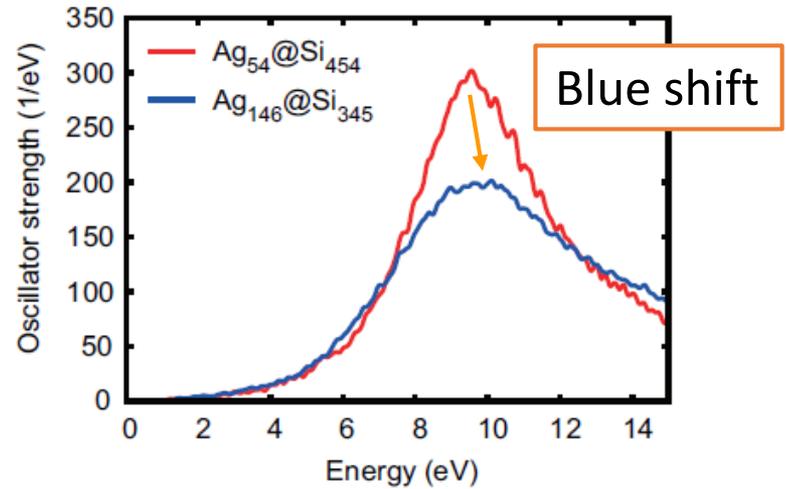

# Applications (2): coreshell structures

$\text{Ag}_{54}@\text{Si}_{454}$

$\text{Ag}_{146}@\text{Si}_{345}$

Diameter: 2.5nm

DOS of coreshell structures differs
